Play store app install download free fire

Amazon's Fire Tablet typically limits you to the Amazon Appstore. But the Fire tablet runs Fire OS, which is based on Android. You can install Google's Play Store and get access to any Android app, including Gmail, Chrome, Google Maps, Hangouts, and the over a million apps in Google Play. RELATED: How to stock the 50's Amazon Fire tablet more like stock Android (without rooting) This doesn't even require rooting your Fire tablet. After you run the script below—this should take less than half an hour—you can use the Play Store just as you would on any other normal Android device. You can even install a regular Android launcher and turn your fire into a more traditional Android tablet. There are two ways to do this: one that involves installing a few APK files on your tablet, and one that involves running a script from a Windows PC. The first one is simpler, but due to the finicky nature of these methods, we are both here. If you have problems with one, you can see if the other works better. Update: Some readers have mentioned that Option One doesn't work for them, although it still works for us – and other readers have since reported that it works for them as well. If you have problems, you should be able to use the ADB method in Option Two below, which uses a Windows PC to install the Play Store. Option One: Install the Play Store from your Fire Tablet We originally tested this first method on a Fire HD 8 with Fire OS 5.3.1.1, but readers have reported that it also works on version 5.3.2, as well as on the 7 Fire tablet. It still works on a Fire HD 8 with Fire OS 6.3.0.1, which was the latest software from October 2018. You can check which version you have by going to Settings &t; Device Options &t; System Updates and looking at the version number at the top of the screen, but at the moment the version shouldn't matter. Step 1: Download the Google Play Store APK files RELATED: How to Sideload Apps on your Kindle Fire before you start, go to Settings &t; Security and activate apps from unknown sources. This allows you to install the required APK files that will help you to use the Google Play Store to help you. Next, there are four .APK files that you need to download with the built-in Silk browser on your tablet. The easiest way to do this is to open this tutorial in the Silk browser and click on the links below that will take you to the download pages. These come from APK Mirror, an established and trusted source for Android APKs. Google Account Manager APK Google Services Framework APK Google Play Services APK (use this version if you have the 2017 Fire HD 8) Google Play Store APK To download each APK file, click the link, scroll down and tap Download APK. The download will begin shortly. If this is the case, a pop-up appears stating that this type of file can harm your device (don't worry - it won't). Tap OK when the pop-up appears. After each file download, do the same thing the next APK file until all four files are downloaded. Step 2: Install the Google Play Store APK files to close from the Silk browser and open the built-in file manager app on your Fire table called Docs. Tap Local Storage. Select the Downloads folder. Your APK files will appear in this folder. Just tap one to start installing. Make sure you install the APK files in the order in which you downloaded them from the list above. In other words, first install the Google Account Manager (com.google.android.gsf.login) APK, then the Google Services Framework (com.google.android.gsf) APK, followed by the Google Play Services (com.google.android.gms) APK, and then the Google Play Store (com.android.vending) APK to exit it. On the next screen, confirm the installation by tapping Install below. Towards the upper left corner it will tell which APK you are installing, so again, make sure you install it in the correct order. NOTE: If your Install button is dimmed, turn off the screen, turn it back on, and unlock your Fire tablet. The Install button should turn from gray to orange so that you can continue with the installation. Repeat this process for each APK file until all four are installed. If you're having trouble installing these APKs, or if the Play Store just doesn't work after that, make sure your Fire tablet isn't set to install apps on an SD card. You can check this using Settings &t; Storage &t; SD Card. Step 3: Use the Google Play Store Once this is done, the Google Play Store app will appear on the home screen of your Fire tablet. If you tap it, you can sign in with your Google Account. It doesn't seem to work normally after you sign in, but just give it some time. The Google Play Store and Google Play Services will automatically update in the background. This can take up to ten minutes. Otherwise, search and download any apps you want—like Chrome, Gmail, or others. Some apps may require you to update Google Play Services. If this is done, they will let you know and take you to the Google Play Services page in Google Play, where you can update Google Play Services with one tap. Many thanks to Gilly10 in the XDA Developers forums for deploying this method. For help troubleshooting, visit the XDA Developers Forum thread for more information. Option 2: Install the Play Store from a Windows PC If the above instructions are for any reason for you, try these slightly more complex but still usable instructions. We tested this script on a 7 Fire tablet and it worked perfectly. Step 1: Prepare your Fire Tablet You need a PC and a USB cable to do this. The cable included in your Fire tablet works fine. On your Fire tablet, open the Settings app and tap Device Options under Device. Locate the Serial Number field on this page and tap it repeatedly. Tap it seven or more times and you'll see the Developer Options option displayed below Tap Developer Options. Locate the Enable ADB option on this page and tap it to enable it. This feature is usually for developers only, so you must agree to the alert to continue. After you enable ADB access, connect your Fire tablet to your computer with the included USB cable. Windows should detect it correctly and download the required drivers. Continue to the next step—if you have any problems, you can try installing Google's USB drivers manually, as described in step 3 of this guide. But on my machine, everything worked automatically. NOTE: The script we recommend below will tell you to install the drivers in a different way, but we don't like the method. It encourages you to install unsigned drivers that are included in the package. This isn't just a security risk—it's actually impossible to do on modern 64-bit versions of Windows 8.1 and Windows 10 without restarting and disabling driver signature verification. Again, everything should be done automatically so that you can consider the script's instructions to be outdated. Step 2: Download and run the script It should be possible to simply download and install multiple apps in APK form. However, if you do this, you must still use the adb command to set permission for at least one of the apps. Instead of doing this on long M and Head, we use a script that installs the apps and sets permissions for you. On your PC, visit the Root Junky website and download the Amazon Fire 5th-Gen Install Play Store .zip file. Extract or unzip the contents of the .zip file to a folder on your computer. Double-click the 1-Install-Play-Store .bat file to get started. Unlock your Fire tablet and agree to the request to allow USB debugging. If you don't see this option, close the Prompt window and restart the .bat file at the top. When you reach the first screen, enter 2 and press Enter to have the tool install the Google Play Store. Of course, the appropriate drivers must be installed to do this. But if you have seen and agreed to the Allow USB debugging prompt on your Fire tablet, you will know that the drivers are already fine. The script installs the required packages on your connected Fire tablet, including Google Play Services and the Google Play Store app. Restart your Fire Tablet when prompted. Just press the power button for a long time, tap OK when asked if you want to shut it down, and then turn it back on. can now disconnect the Fire Tablet from your computer. You can also disable the Enable ADB option that you previously enabled. Step 3: Use the Google Play Store After rebooting, you'll find the Play Store and Google Settings shortcuts on your home screen. Tap Play Store and you can sign in with an existing Google account or create a new Google account. It doesn't seem to work normally after you sign in, but just give it some time. The Google Play Store and The Google Play Services automatically update in the This can take up to ten minutes. You can now browse the Store and install Google apps like Gmail and Chrome that aren't available in the Amazon App Store. Any Android app from the Google Play Store should work – at least in theory. Some apps may require you to update Google Play Services. If so, they will let you know and take you to the Google Play Services page in Google Play, where you can update Google Play Services with a single tap on a button. Thanks to sd_shadow in the XDA developers forums for writing some of this method and Root Junky for the script. If you need troubleshooting help or want to do so manually without a script, visit the XDA Developers Forum thread for more information. Information.
